Introduction

Excited? You should be – you're about to install DataFlex – an advanced rapid development and deployment platform for mobile, web and desktop Windows business applications.

This guide provides information about available installation components, the installation process, supported operating systems, system requirements and more.

DataFlex Installation Files

There are individual files to install each of the following:

DataFlex Studio

DataFlex Studio is the developer's workbench for designing, coding, assembling, compiling and debugging mobile, web and Windows Desktop applications. A comprehensive business application framework and the versatile, readable DataFlex language are the developer's tools. The Studio includes Data Access Worldwide's database drivers (called: Connectivity Kits) for use with Microsoft SQL Server, IBM DB2, MySQL, MariaDB, Amazon Aurora, PostgreSQL, Oracle, other ODBC Data Sources (with Embedded SQL support) and Pervasive PSQL.

Each application developer requires an individual DataFlex Studio License. Please refer to the Software License Agreement for details.

File name: **DataFlex 2021 Studio 20.0.x.x.exe**

DataFlex Web Application Server

The DataFlex WebApp Server delivers dynamic, fast, secure, mobile and web applications and web services developed with DataFlex Studio. WebApp Server, which runs on Microsoft operating systems (details below) and IIS, is the business logic engine for back-end database integration and centralized business rule and process execution required for mobile and web apps and web services.

Each deployment of a DataFlex WebApp Server in a "server instance" – a cloud, virtual or hardware based server environment – requires its own, dedicated license. Please refer to the Software License Agreement for details.

The DataFlex Web Application Server installation program has configurable command line arguments that define various options, placement of files and the details displayed during installation.

For detailed information on how to deploy DataFlex Web applications, refer to the "[Deploying Web Applications](#)" section of the DataFlex Help system.

File name: **DataFlex 2021 Server 20.0.x.x.exe**

DataFlex Windows Client

The DataFlex Windows Client is the set of components installed by the DataFlex Windows Client Installation Program to execute Windows desktop applications on supported Microsoft operating systems (details below). Each deployment on a server instance of a DataFlex desktop Windows application requires the installation of a DataFlex Windows Client with its own, dedicated license for the application's number of users. Please refer to the Software License Agreement for details of the

permitted and excluded uses DataFlex Windows Client.

The Windows Client installation program has configurable command line arguments that define various options, placement of files and the details displayed during installation.

For detailed information on how to deploy DataFlex desktop Windows applications, see "[Deploying Windows Applications](#)" in the DataFlex Help system.

File name: **DataFlex 2021 20.0.x.x.exe**

Product Registration and Operation

All DataFlex products are pre-configured to operate in 60-day evaluation mode unless customer specific license details, encoded in a "Registration Code", are entered via the Register.exe program. Registration Codes control the type of license, number of users or, for WebApp Server, the number of applications licensed to run. Each Registration Code is unique to a specific customer's Registration Name and DataFlex Serial Number. Registration Codes will be provided at the time of purchase, or, for DataFlex Personal, after license registration. Keep your Registration Code handy since you will need it to complete the installation and registration process. An .INI file containing your DataFlex Registration Code and other information necessary for product registration is provided with your license. The .INI file can be read by Register.exe to automate DataFlex registration.

Entering your commercial or Personal registration information will remove the evaluation limitations.

See below to register DataFlex Personal.

If you purchase an update to an existing DataFlex license (e.g. version upgrade, additional users or applications), you will receive a replacement Registration Code that enables the changes in your installed software. Install the new Registration Code with your existing Registration Name and Serial Number using Register.exe.

You must fully register your new DataFlex License to qualify for technical support and future updates.

If not done during installation, registration is accomplished using the utility program Register.exe. Register.exe is also used to enable changes to your license via a new Registration Code. Register.exe is located as follows:

- DataFlex Studio and WebApp Server: On the Start Menu and in C:\Program Files\DataFlex 20.0\Bin64 (default location unless modified during installation)
- DataFlex Windows Client: C:\Program Files\DataFlex 20.0\Bin64 (default location unless modified during installation)

Registering DataFlex Personal

DataFlex Personal is a no-cost of DataFlex Studio license with limited deployment licenses for developing and deploying personal, private use, non-commercial applications. With Personal, developers can...

- Get acquainted with DataFlex without making a financial commitment
- Have a free, fast & easy mobile, web and Windows development tool for personal, non-commercial applications (see the Software License Agreement for full details)

We believe so strongly that you will be thrilled with the power, efficiency and productivity of DataFlex that if you try Personal, you will decide to use it, buy a Commercial license and join our developer community. Private use of DataFlex Personal is free; for business use, a Commercial license must be purchased. All we require for Personal is that you register your license and activate it upon installation.

When you register DataFlex Personal, we will send you a unique serial number and Registration Code by email. Registering Personal can be done during DataFlex installation. If you did not register during installation, you can register at: <https://www.DataAccess.com/DataFlex/TryPersonal>

And, while you're there, sign up for our FlexLinks newsletter too!

DataFlex Installation Procedure

When you have the DataFlex installation file ready to install and, optionally, your Serial Number, Registration Name and Registration Code, you are ready to proceed with installation using the following steps:

1. For any existing DataFlex Studio, Windows Client or WebApp Server installation, backup all your data, source code, DataFlex applications and registry entries
2. Uninstall all instances of Beta or Pre-release versions of DataFlex prior to installing the current release. You can uninstall by clicking on the Programs and Features or Add/Remove Programs option in the Windows Control Panel. Then select the appropriate DataFlex version to remove from your system. Choose the Automatic Uninstall option to remove all DataFlex installed files for the selected version. Any user-generated directories for the selected version will remain intact.
3. After uninstalling any revision of DataFlex, restart your computer prior to installing another build or revision of DataFlex.
4. Make sure you are running a supported operating system and run the appropriate installation program as listed above.

To start the installation process, double-click on the installation file specific to your DataFlex license.

Supported Operating System and Browser Environments

DataFlex 2019 Studio, Windows Client and WebApp Server are supported on:

- Windows 10
- Windows Server 2019
- Windows Server 2016

Notes on Installation Environments

When used in conjunction with Windows Server 2019 and Windows Server 2016, DataFlex Studio and Windows Clients are supported on Windows Terminal Services.

When used in conjunction with other supported Windows operating systems, DataFlex Studio and Windows Client are supported on Citrix Virtual Apps and Desktops (formerly XenApp and XenDesktop).

Microsoft Internet Information Services (IIS) must be installed and operational to run DataFlex WebApp Server.

Web Browsers supported in the DataFlex Framework

- Microsoft Chromium-based Edge and Internet Explorer 11
- Chrome, Firefox, Safari, and other modern browsers

Unsupported & Obsolete Platforms

Data Access Worldwide will not investigate reported issues in our "[Current Products](#)" that occur on an operating system, database server or other third party product if, before or since our product's release, the vendor's "Mainstream" or similar support level has expired or the third party product has otherwise become obsolete.

Database & Connectivity

Application connectivity to leading SQL databases is essential for creating reliable, high-performance business applications. Each DataFlex 2021 installation file includes the connectivity components for the SQL databases listed below.

- Microsoft SQL Server 2017 and higher
- IBM DB2 11.5 and higher
- MySQL 8.0.19 and higher
- MariaDB 10.5.4 and higher
- Amazon Aurora 2.07.2 (based on MySQL 5.7)
- PostgreSQL 12.3
- Oracle 18c and higher

Note that to work with Unicode data, the collating of the database can be an important part of the environment being set up. See the Help for more information.

ODBC Connectivity Kit

A variety of databases and data sources can be accessed through ODBC. These include enterprise database servers such as Microsoft SQL Server, MySQL, Oracle and PostgreSQL, flat file databases and even non-database data like Excel and ASCII files. Use of the DataFlex ODBC Connectivity Kit also requires the installation of a specific ODBC Driver for each target data source.

You can find ODBC configuration information specific to database backends like MySQL (MySQL.int) and Oracle (Oracle.int) in the \Bin directory. These files should be modified according to your specific installed version of the target database.

Connectivity Entitlements

While the connectivity components are installed with DataFlex, their use is based on the particular DataFlex license purchased. SQL database connectivity is ON or OFF for installed DataFlex software as follows:

- **DataFlex Studio** – always ON
- **DataFlex WebApp Server**
 - ON when purchased with the WebApp Server. If connectivity entitlements are not purchased with the server, the default is OFF.
- **DataFlex Windows Client**
 - ON when purchased with the Windows Client. If connectivity entitlements are not purchased with the client, the default is OFF.

DataFlex Studio, WebApp Server and Windows Client also include the free DataFlex embedded flat file database. Special configuration of local area networks is required for the reliable use of any flat file database in production application environments.

Use of an SQL server is highly recommended for production DataFlex applications.

Customer Support Overview

Data Access Worldwide endeavors to provide superior support to help customers build great applications and gain the maximum benefits from our products.

Visit the Data Access Worldwide Support Home page (<https://www.dataaccess.com/support>) to see our support options, a list of current products and procedures for bug reporting and monitoring.
